

Splunk Health Check Overview

A Splunk health check is offered free of charge for organisations to review their current usage and implementation of Splunk, and how it is developing over time.

The Health Check can either be run alongside a customer-side contact or run solo via remote connection if preferred.

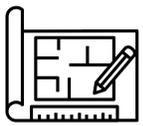

Required Connection

Either a connection via remote desktop, or screenshare, the user requires admin access to the UI of Splunk and would be helpful if the customer contact had an awareness of the deployment however is not necessary.

Areas of Investigation

During the Health Check we go through various checks of the system, as well as discussing your future use cases and any questions you may have.

A roundup report is created in the time following the health check and provided back to the customer alongside any recommendations.
